

Figure 1 consists of three scatter plots showing the distribution of Median $\log_2(\text{Fast/Slow Expression})$ for three bacterial species: *E. coli*, *B. subtilis*, and *V. natriegens*. Each plot has a vertical line at 0 and a horizontal dashed line at approximately -1.5. The x-axis is labeled 'Median $\log_2(\text{Fast/Slow Expression})$ '. The y-axis is unlabeled but represents the same metric. Data points are colored red and blue, representing two different conditions. In *E. coli*, the red points are generally higher than the blue points. In *B. subtilis* and *V. natriegens*, the points are more mixed, with some red points being higher and others lower than the blue points.
